The piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss) was fused upstream to the EcoRI-SalI cDNA fragment encoding the lipopolysaccharide-binding domain of Carcinoscorpius rotundicauda Factor C CrFCES for expression and secretion of recombinant ES protein from Drosophila cells. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 204 BP; 48 A; 45 C; 58 G; 53 T; 0 other;

                                                              g
                                                                                   ò
                                                                                                      g
```

amino acid sequence at least 95 dentical to a polypeptide sequence of sequence at least 95 dentical to a polypeptide sequence of sequence at least 95 dentical to a polypeptide sequences of sequences included in American Type Culture Collection (ArcC) deposit number collection and the specification. The products of the invention have cytostatic, antiarthritic, antiasthmatic, immunosuppressive, nootropic; antiarterlosclerotic, antiasthmatic, immunosuppressive, nootropic; tranquiliser, vulnerary, antibacterial, antipsoriatic, antiarrhythmic, antiartheumatic, cardiant and anti-HIV activity. (I) or a nucleic acid (II) encoding (I) is useful for preventing, treating or amedicating a medical condition and for diagnosing a pathological condition or susceptibility to the condition (I) is useful for identifying a binding partner which affects the activity of the polypeptide and for identifying an activity in a biological sample. (I), (II) or an antibody (IV) specific to (I) is also useful for treating or preventing a disease, disorder or condition

This invention describes a novel isolated polypeptide (I) comprising

```
disorders when disorders such as autoimmune diseases, blood protein disorders, anemia, allergic reactions and conditions such as asthma, organ rejection or graft-versus-host disease, inflammation, hyper proliferative disorders, cardiovascular disorders such as asthma, corgan rejection or graft-versus-host diseases, inflammation, hyper proliferative disorders, cardiovascular disorders such as arterioarterial fistula, arrhythmias, arteriosclerosis, coronary thrombosis, organ regeneration, cancer, neovascular glaucoma, diabetic retinopathy, rheumatoid arthritis, psoriasis, diseases associated with increased apoptosis that include acquired immunodeficiency syndrome (AIDS), neurological diseases such as Parkinson's disease, viral, bacterial, fungal or parasitic diseases. They are also used to repair, replace or protect tissue damage by congenital defects, to treat trauma, in surgery, including cosmetic plastic surgery, to treat fibrosis, reperfusion injury or systemic cytokine damage, to stimulate chondrocyte growth, to prevent skin ading due to sunburn, to change a mammal's mental state or physical state by influencing biorhythms, cardiac rhythms, depression, memory, or antagonist are useful as food additives or preservatives to increase
associated with aberrant expression of (I). Diseases treated or diagnosed
                                                                                                                                                                                                                                                                                                                                                                                             or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamin, mineral or other nutritional components. (I) is useful in for screening therapeutic compounds. (II) is useful in forensic biology for detecting DNA sequences and as diagnostic probes for detecting the presence of specific mRNA in a particular cell type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 attcacatccaccagccatgagggtgcttgtactagctcttgctgtggctctcgcagtgg 60

                                                 This sequence encodes sheep beta-lactoglobulin and contains a unique ECORV site at nucleotide 4445 in the 5' untranslated region of the gene. This site allows insertion of additional DNA sequences under the control of the beta-lactoglobulin promoter 3' to the transcription initiation site. The promoter and signal peptide may be used for mamma tissue-specific gene expression and secretion of human fibrinogen A-chain (see T03853), B-beta chain (T03854) in non-human transgenic animals. A region of at least the proximal 406 bp of 5' flanking sequences (nucleotides
                                                                                                                                                                                                                         beta-lactoglobulin sequences providing a putative tissue-specific initiation environment to enhance expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protein C; transgenic animal; sheep; rabbit; cattle; goat; milk;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human beta-lactoglobulin 5' fragment used to construct hybrid genes
                                                                                                                                                                                                                                                                                                       propertide, operably linked to DNA encoding two-chain cleavage site-modified protein C (see W25085-86), the 2 DNA sequences being linked to elements required for protein C expression in a mammary gland of a most female animal, such as beta-lactoglobulin gene promoter; and (b) using the DNA construct to breed a transgenic animal (esp. sheep, rabbit, cattle, goat) that produces protein C in its milk, at least 90% of the protein C being in the two-chain
                                                                                                                     This DNA sequence comprises the ovine beta-lactoglobulin gene including the promoter region. A DNA segment encompassing the 5' flanking promoter region can be utilised in novel constructs for the expression of human protein C in the milk of a transgenic animal. A claimed method involves: (a) providing a DNA construct comprising DNA encoding a secretion signal and a protein C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 10807;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 10807 BP; 2214 A; 3066 C; 2985 G; 2542 T; 0 other;

                                                                                                                                                                                                                                                     ö
                                                                                                                            The present sequence represents a fragment of beta-lactoglobulin (BLG) used in the construction of hybrid genes. The hybrid construct comprises BLG 5'-flanking sequences and BLG intragenic sequences in conjunction with a desired cDNA or minigene or gene for targetting expression of the encoding DNA. The construct is used for producing transgenic mammals that secrete human serum albumin (HSA) in their milk. By using BLG, the

The invention provides a transgenic bovine in which the somatic and germ cells contain a transgene comprising a regulatory sequence from a gene expressed in mammary glands, DNA encoding a signal sequence and DNA encoding a naturally occurring heterologous polypeptide. The transgenic bovine, or its descendants, produce milk containing the heterologous polypeptide. The transgenic bovines are used to express human milk and serum proteins or industrial enzymes, specifically for infant formulations that contain human lactoferrin for control of intestinal tract infections and to improve iron absorption, particularly when potentiated by human lysozyme. The polypeptide expressed in milk of the transgenic bovine requires little if any purification before human consumption and is expressed at significantly higher levels than in
regulator, for expressing proteins in the milk, particularly human lactoferrin for infant feeding formulations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heyneker HL, Platenburg G, Pieper F, Krimpenfort PJA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transgenic mice or sheep. Large polypeptides that are difficult to express in other systems can also be expressed. The present sequence represents a sheep beta-lactoglobulin gene fragment.

```
New transgenic bovine whose mammary gland cells contain DNA encoding a signal sequence, and a polypeptide of interest and an expression regulatory sequence, for producing polypeptides in bovine milk -
                                                                                                                                                              invention relates to a transgenic or chimeric bovine whose
                                                                                                                                                                                  mammary gland cells contain a construct encoding a signal sequence, a polypeptide of interest and a regulatory sequence that promotes expression of the DNA sequence. The transgenic or chimeric bovine is
                                                                                                                                                                                                                                                                useful for producing recombinant polypeptides in milk of female transgenic mammals. The recombinant polypeptide may be used in food formulations, particularly in infant formula having either nutritional or beneficial value. An infant formula containing human lactoferrin from the transgenic bovine milk provides bacteriostatic effect, which aids in controlling diarrhoea in newborn. Recombinant polypeptides may also be used to supplement common diet formulations.
                                                                                                         English
                                                                                                         Disclosure; Fig 24; 88pp;
                                                                                                                                                                 The present

Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer -

```
called prostate cancer antigens, given in B6563 to B5730. The prostate cancer antigens, given in B6563 to B5730. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, neptrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, real, and proliferative disorders, wounds, and infectious diseases. F16506 to F16514 to B57303 represent sequences
                                                       to F16505 encode the human prostate cancer associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                 used in the exemplification of the present invention.

```
which encodes 2-2-83 protein. The expression of this gene is modulated by hypoxic conditions. 2-2-83 protein has anti-hypoxic, vasotropic, neuroprotective, antiapoptotic, anglogenic and tumourigenic activity. It can be used for diagnosing and treating hypoxia and ischaemia and regulating apoptosis, anglogenesis, neurite outgrowth and tumourigenesis. 2-2-83 nucleotide sequence may be used in gene therapy and is a useful source of diagnostic probes to identify hypoxia
                                                                                                                                                                                                associated pathologies

WPI; 2000-341710/30 P-PSDB; Y92730. Novel isolated Seladin-1 polypeptide useful in the diagnosis, prognosis and treatment of neurological diseases, e.g. Alzheimer's disease and Amyotrophic lateralsclerosis

Claim 1; Fig 14; 47pp; English.

The present cDNA encodes seladin-1. The cDNA was isolated by differential display PCR using total RNA from post-mortem brain tissues from Alzheimer's disease patients and control subjects. The seladin-1 cDNA or protein reduces or prevents the degeneration of neurons and slows brain amyloid formation. They may be used to diagnose or prognose a neurological disease or to evaluate a treatment for a neurological disease (claimed). Neurological diseases treatable by seladin-1 cDNA or protein include Alzheimer's disease, Parkinson's disease, Huntingdon's disease, Amyotrophic lateralsclerosis and Pick's disease.

-!- CATALYTIC ACTIVITY: ATP + H(2)0 = ADP + ORTHOPHOSPHATE.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-!- SUBLEALINGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFAMILY IV.

-!- CAUTION: REF.1 SEQUENCE DIFFERS AT SEVERAL POSITIONS FROM THAT SHOWN DUE TO DIFFERENCES IN THE PREDICTION OF SPLICE SITES.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Lamerdin J.E., McCready P.M., Skowronski E., Adamson A.W.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          entities requires a license agreement (See http://www.isb-sib.ch/announce/
or send an email to license@lsb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                            ATESUE SPECIFICITY: PRODUCED BY THE LIVER, SECRETED INTO THE BLOOD AND THEN SEQUESTERED BY RECEPTOR MEDIATED ENDOCYTOSIS INTO GROWING COCYTES, WHERE IT IS GENERALLY CLEAVED, GIVING RISE TO THE RESPECTIVE YOLK COMPONENTS LIPOVITELLINS AND PHOSVITIN.
INDUCTION: SYMTHESIZED IN THE LIVER OF OVIPAROUS VERTEBRATES IN RESPONSE TO STEROID (ESTROGEN) INDUCTION. STEROID INDUCED EXPRESSION OF VTG II IS LOWER THAN THAT OF VTG I.

PTW. PHOSVITIN, AN EGG YOLK STORAGE PROTEIN, IS ONE OF THE MOST HIGHLY PHOSPHORYLATED (10%) PROTEINS IN NATURE (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Serra A., Pirastu M.;

"A common beta ig-h3 gene mutation (delta F540) in a large cohort of Sardinian Reis Buecklers' corneal dystrophy patients.";

Hum. Mutat. 12:215-216(1998).

- FUNCTION: BINDS TO TYPE I, II, AND IV COLLAGENS. THIS ADHESION PROTEIN MAY PLAY NIMPORTANT ROLE IN CELL-COLLAGEN INTERACTIONS.

- SUBCELLULAR LOCATION: EXTRACELLULAR. MAY BE ASSOCIATED BOTH WITH MACROFIENTS. AND WITH THE CELL SURFACE.

- INDUCTION: BY TGF-BETA.

- INDUCTION: BY TGF-BETA.

- DISEASE: DEPECTS IN TGFBI ARE THE CAUSE OF AT LEAST FIVE AUTOSOMAL DOMINANT TYPES OF CORNEAL DYSTROPHIES: GRANILAR DYSTROPHY GROEBOUW
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Munier F.L., Korvatska E., Djemai A., le Paslier D., Zografos L., Pescia G., Schorderet D.F.;

-I FUNCTIONE BINDS TO TYPE I, II, AND IV COLLAGENS. THIS ADHESION PROTEIN MAY PLAY AN IMPORTANT ROLE IN CELL-COLLAGEN INTERACTIONS.

IN CARTLLAGE, MAY BE INVOLVED IN ENDOCHONDRAL BONE FORMATION. MAY PLAY AN IMPORTANT ROLE IN THE MORPHOGENESIS OF CORNEAL TISSUES.

-I SUBCELLULAR LOCATION: EXTRACELLULAR, MAY BE ASSOCIATED BOTH WITH MICROFIBRILS AND WITH FRE CELL SURREACE (BY SIMILARITY).

-I TISSUE SPECIFICITY: LOCATED PRIMARILY IN THE EPITHELIUM OF NORMAL ADULT CORNEA, IN PETAL STROMAL CELLS, AND BOTH ENDOTHELIUM AND STROMA-DERIVED CELLS IN HEALING CORNEAL WOUNDS. NOT EXPRESSED IN NORMAL ADULT ENDOTHELIUM AND STROMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Halleck M.S., Lawler J.F. TYGSTUDY PRODUCTION TO THE TOWN THE TRANSPORT OF AMINOPHOSPHOLIPIDS FROM THE OUTER TO THE INNER LEAFLET OF VARIOUS MEMBRANES AND THE MAINTENANCE OF ASYMMETRIC DISTRIBUTION OF PHOSPHOLIPIDS IN THE MAINTENANCE OF ASYMMETRIC DISTRIBUTION OF PHOSPHOLIPIDS IN THE CANICULAR MEMBRANE. MAY HAVE A ROLE IN TRANSPORT OF BILE ACIDS INTO THE CANALICULUS, UPTAKE OF BILE ACIDS FROM INTESTINAL CONTENTS INTO INTESTINAL MUCOSA OR BOTH.

CONTENTS INTO INTESTINAL MUCOSA OR BOTH.

CHARLET LOLEST FOUND IN MOST TISSUES EXCEPT BAIN AND SKELETAL MUSCLE. MOST ABUNDANT IN PANCREAS AND SMALL INTESTINE.

CHOLESTASE: DEFECTS IN FICI ARE THE CAUSE OF PROGRESSIVE FAMILIAL INTENDED BY EARLY INFANCY CHOLESTASIS, THAT MAY BE INITIALLY EPISODIC BUT PROGRESSES TO MALUNDENT RETARDATION AND END-STAGE LIVER DISEASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL outstation

Neurobiol. 22:74-84(1991).

1. Neurobiol. 22:74-84(1991).

2. FUNCTION: THIS MAJOR SOLUBLE PROTEIN IN OLFACTORY SENSILLA OF NALE MOTHS MIGHT SERVE TO SOLUBLILIZE THE EXTREMELY HYDROPHOBIC PHEROMONE MOLECULES AND TO TRANSPORT PHEROMONE THROUGH THE AQUEOUS LYMPH TO RECEPTORS LOCATED ON OLFACTORY CILIA. PBP IS ALSO FOUND IN SENSILLA FROM FEMALE M.SEXTA ANTENNAE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Manduca sexta (Tobacco hawkmoth) (Tobacco hornworm).

This sequence is that of a piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss). This and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding for oding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                     detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence

                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                    A reporter GFP system that uses the piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss), designated pVtgEGFP was constructed. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an osstrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                              ó
                    Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence encoding secretory signal sequence

The piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss)
was fused upstream to the EcoRI-Sall cDNA fragment encoding the
lipopolysaccharide-binding domain of Carcinoscorpius rotundicauda Factor
C CrFCES for expression and secretion of recombinant ES protein from
Drosophila cells. Vtgss and variants that comprise conservative
replacements that retain the biological activities of directing secretion
of a fusion protein from a cell and claevage of the secretory signal
sequence from the fusion protein, are new. DNA encoding the Vtgss can be
fused to either a reporter protein or a lipopolysaccharide-binding
for the terologous gene expression, detecting the presence of a compound
that binds to an oestrogen receptor in a sample or producing a desired
protein from a host cell. It can also be used in a method for obtaining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      29-JUN-1999
30-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-JUN-1
                                                                                                                                                                                                   A reporter beta-lactamase system that uses the Oreochromis aureus, vitellogenin secretory sequence (Vtgss), designated pBADVtgblactKana was constructed. Vtgss and variants that comprise conservative replacements that retain the blological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The lasolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                  Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence encoding secretory signal sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Sinte="Vector: pME10BS-FL3" site_1: DraIII (CACTGTGTG);
Site_2: DraIII (CACCATGTG); 1st strand cDNA was primed with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested and cloned into distinct DraIII sites of the pmE18S-FL3 vector [5' site CACTGTGTG, 3' site CACCATGTG, XhoI should be used to isolate the cDNA

/note==vector: pME18S-FL3; Site_1: DraIII (CACTGTGTG);
Site_2: DraIII (CACCARGTG); 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor
[FGTTGGCCTACTGG], digested and cloned into distinct DraIII
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sumio Sugano
(University of Tokyo Institute of Medical Science) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Actinopterygii; Neopterygii; Teleostei; Euteleostei; Ostariophysi; Cypriniformes; Cyprinidae; Rasborinae; Danio.

FEATURES

```
with an oligo(dT) primer [ATGNGGCTTTTTTTTTTTTT];
double-stranded oDNA was lgated to a Draili adaptor
[TGTNGGCTACTGG], digested and cloned into distinct Draili
sites of the pWE18S-FL3 vector [5' site CACTGTGTG, 3' site
CACCATGTO). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
<1.5Xb. Library constructed by Dr. Sumio Sugano
(University of Tokyo Institute of Medical Science) and
kindly donated by Dr. Kolchi Kawakami. Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGGG and 3' end
primer CGACCTGCAGCAGCAG.

primer CGACCTGCAGCAGCAGAG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Actinopterygii; Neopterygii; Teleostei; Euteleostei; Ostariophysi; Cypriniformes; Cyprinidae; Rasborinae; Danio.

/lab_host="wector: pME18S-FL3; Site_1: DraIII (CACTGTGTG);
Site_2: DraIII (CACCATGTG); 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor
[TGTTGGCCTACTGG], digested and cloned into distinct DraIII
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). MoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
cl.Skb. Library constructed by Dr. Sumio Sugano
(University of Tokyo Institute of Medical Science) and
kindly donated by Dr. Koichi Kawakami. Custom primers for
sequencing: 5' end primer CTTCTGCTGTAAAGGTGCG and 3' end
primer CGACCTCGAGCACA.
